MY DUBAI BROKER

Backend Dashboard and Partner Portal

Complete functional plan for the developer team

Prepared by Ram
Developer Meeting - 22 September 2026

The objective is simple: every company owner, manager and agent must know what is happening, what needs attention and what to do next.

SECTION 01

The direction I want us to follow

Property Finder is a useful benchmark for listing operations, but My Dubai Broker should not feel like a copied portal. Our platform covers several luxury asset categories and needs a simpler, more guided experience.

What I need the dashboard to do

When a company owner logs in, the dashboard should answer five questions immediately: What is live? What needs attention? How are my listings performing? Why is a listing receiving low visibility? What action should I take next?

The product principles

Simple before impressive

A user should understand the screen without training or a separate manual.

Actions before decoration

Every warning, score or status must lead to a clear next action.

One complete journey

Do not deliver isolated screens. Demonstrate the complete workflow from registration to enquiry.

Different roles, different views

Company owners, managers, agents and platform reviewers should not see the same menu.

Transparent visibility

A partner must understand why a listing has low exposure and how to improve it.

Built for all categories

The database and forms must support real estate, cars, yachts, private aviation and collectibles.

How I will judge the finished dashboard

- A new partner can complete onboarding without calling us for help.
- An agent can find assigned listings and enquiries within two clicks.
- An administrator can approve, request changes or reject without opening several pages.
- Every status change, score change and lead action is recorded.
- The numbers shown on the dashboard come from real backend data, not static counters.

SECTION 02

Lock the platform structure before adding more screens

The main data model must be agreed now. If category, offering and user ownership are mixed together, the team will have to rebuild forms, filters and search later.

Core structure

Layer	Examples	Rule
Category	Real Estate, Cars, Yachts, Private Aviation, Collectibles	A category defines the main data schema and verification requirements.
Asset type	Villa, Apartment, Sports Car, Yacht, Jet, Helicopter	Asset type sits under a category and controls the detailed fields.
Offering	Sale, Long-Term Rent, Short-Term Rent, Charter	Rental is an offering, not a universal backend category.
Company	Brokerage, dealer, charter company, owner representative	The company owns its users, listings, documents and enquiries.
User	Owner, manager, agent, coordinator, viewer	Every person receives an individual login and permission set.

Important naming decision

Use Private Aviation as the category. Jet and Helicopter should be asset types. The public website can still have a Rentals page, but the backend should store rental or charter as an offering.

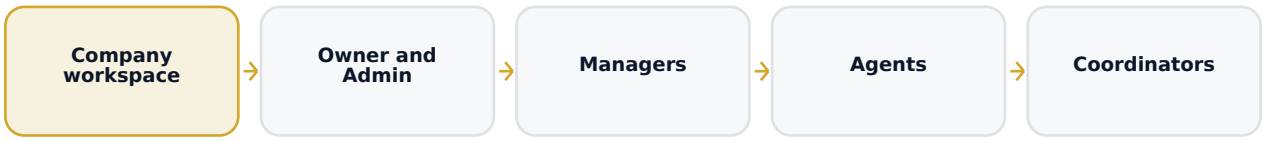

Data rules that must be consistent

- Currency is selected per listing. Do not hard-code USD or AED.
- Every record uses a unique internal ID and a readable public reference number.
- Every listing belongs to one company and has one primary responsible user.
- Category-specific fields are configured, not added as one large universal form.
- Approval status and publication status remain separate.
- Raw database values such as REAL_ESTATE must never appear in the interface.

SECTION 03

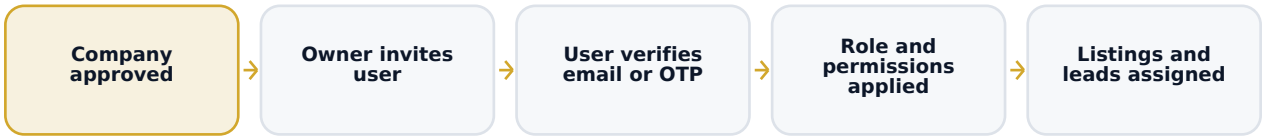

Company accounts, agent accounts and permissions

A company should be one workspace with individual user accounts underneath it. A shared company login is not acceptable for security, lead ownership or performance reporting.

Role	Main access	Restrictions
Company Owner	All company listings, leads, team, performance, documents and settings	Cannot access another company or platform controls.
Company Manager	Team listings, lead assignment, team reports and review queue	No ownership transfer, billing or sensitive company changes unless allowed.
Agent	Own profile, assigned listings, assigned leads and personal performance	No access to other agents' private leads, billing or company documents.
Listing Coordinator	Create and edit listing drafts, upload media and submit for company review	No lead export, billing or user administration.
Viewer	Read-only dashboards and reports	No editing, approvals, downloads of sensitive documents or exports.
Platform Reviewer	Assigned company and listing verification queues	No system configuration or unrelated partner data.
Super Admin	Full platform operations, configuration and audit access	Sensitive actions must be logged and require a reason.

Agent invitation flow

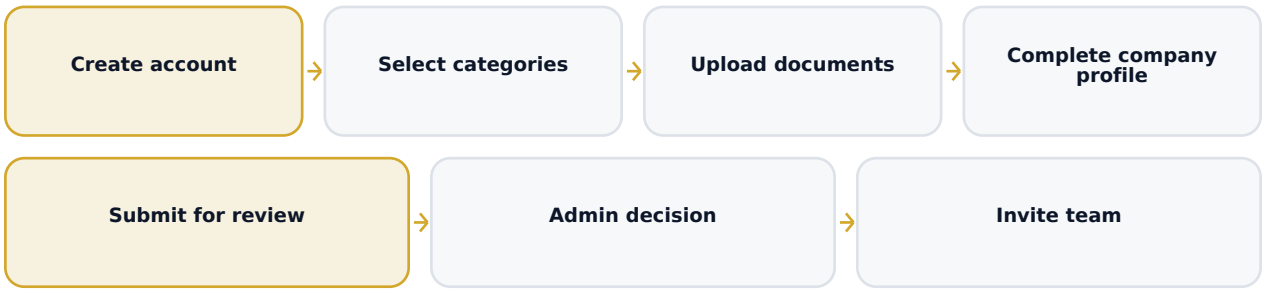

When an agent leaves

Deactivate access immediately, preserve the activity history and reassign open listings and enquiries. Do not delete past records. The company owns the business records; the user account only controls access.

SECTION 04

Company onboarding and verification flow

Onboarding must be a guided process with saved progress, clear document requirements and an exact review status.

Required behaviour

- Save progress automatically and allow the owner to continue later.
- Show a completion percentage and a checklist of missing items.
- Change document requirements according to selected categories.
- Capture document number, issuing authority, issue date and expiry date where relevant.
- Allow the reviewer to approve, request changes or reject each document with a reason.
- Send the partner directly to the field or document that needs correction.
- Keep every submission, review comment and resubmission in an activity history.

Company verification statuses

Category	Examples of verification data	Notes
Real Estate	Trade licence, company registration, RERA or relevant authority details	Agent credentials such as BRN are connected to the individual agent profile.
Cars	Trade licence, dealer or rental activity, authorised representative	Requirements must change for sale and rental businesses.
Yachts	Trade licence, listing authority, registration or ownership support	Final requirements should be confirmed before production.
Private Aviation	Trade licence, operator or broker authority, asset documentation	Jet and helicopter requirements may differ.
Collectibles	Business identity, ownership or consignment authority, authenticity support	High-value items may require enhanced review.

SECTION 05

Company owner dashboard

The home page should be an operating centre, not a portfolio gallery. The owner must see business performance and pending actions in one place.

24	6	3	18
LIVE LISTINGS	PENDING REVIEW	CHANGES REQUIRED	NEW ENQUIRIES

Top section

- Live, draft, pending, changes required, rejected and expiring listing counts.
- Views, enquiries, enquiry conversion rate and average first-response time.
- Date range and category filters that update every card and chart.

Action Required

Listing quality

Three listings need additional images or missing specifications.

Lead response

Two new enquiries have not been opened within the required response window.

Documents

A company or agent document is approaching expiry.

Approval feedback

One listing was returned with a reviewer comment.

Availability

Four live listings need availability confirmation.

Low visibility

Two listings have actions available to improve their search position.

Performance blocks

- Top-performing listings by qualified enquiries, not only views.
- Listings with high views but low enquiry conversion.
- Agent response performance and unassigned enquiries.
- Document and listing expiries for the next 7, 30 and 60 days.
- Recent activity: submissions, approvals, changes, enquiries and team actions.

The test

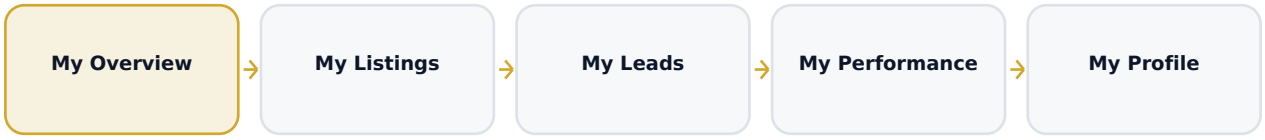

A company owner should know the state of the account within 10 seconds and reach any urgent action within two clicks.

SECTION 06

Agent dashboard and daily workflow

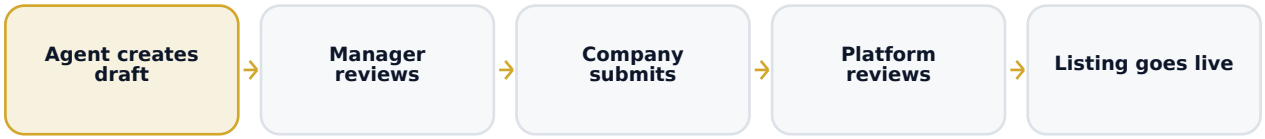

The agent dashboard should be smaller and more focused than the company owner dashboard. It should show only the work assigned to that user.

Agent navigation

Section	What the agent sees	Main actions
My Overview	Today's new leads, overdue follow-ups, listings requiring action	Open lead, update status, fix listing.
My Listings	Assigned drafts, pending, live, paused and returned listings	Create draft, edit, preview, submit to manager.
My Leads	Only leads assigned to the agent unless wider access is granted	Call, WhatsApp, add note, schedule follow-up, update stage.
My Performance	Views, enquiries, response time, qualified leads and conversions	Filter by date and listing, export own report if permitted.
My Profile	Photo, contact details, languages, biography and professional credentials	Update editable fields and renew credentials.

Recommended company review flow

Permission rule

An agent can be given permission to create listings, but the company owner or manager should decide whether that agent can submit directly to the platform. This permission must be configurable per user.

Public agent profile and login account are different

The login account controls authentication and permissions. The public profile controls the name, photo, languages, biography, contact options and category credentials displayed to customers. Keep these as connected but separate records.

SECTION 07

Super Admin dashboard and operations

The administrator needs an operational queue with clear priorities. A large empty page with counters is not enough.

Recommended Super Admin navigation

Overview

Platform activity, pending work, risk alerts and performance.

Company Approvals

Applications, documents, assigned reviewer and decision history.

Listing Approvals

Pending review, changes required, approved and rejected listings.

All Listings

Searchable management table across every company and category.

Leads

Enquiry volume, routing health, response SLA and unresolved records.

Configuration

Categories, fields, quality rules, ranking rules and notification templates.

Users and Roles

Platform staff, partner users, access status and permissions.

Reports

Listing, company, lead and performance exports.

Audit and Security

Sensitive actions, document access, login and system history.

Every review queue must include

- Search, category, company, reviewer, date, age and status filters.
- Oldest submissions first and an overdue indicator.
- Direct Approve, Request Changes, Reject, Suspend and Assign Reviewer actions.
- Mandatory reason for rejection, suspension and manual overrides.
- Internal notes separated from comments visible to the partner.
- Bulk assignment and export, but not bulk approval of unreviewed records.

Admin experience

The administrator should be able to understand the record, view documents, compare changes, write a reason and complete the decision without moving between several disconnected pages.

SECTION 08

Listing management must support scale

A card view is suitable for browsing a small portfolio. Companies and administrators also need a table view for managing hundreds or thousands of records.

Required table columns

Identity	Commercial	Control	Performance
Thumbnail, title, reference	Category, offering, asset type	Company, owner, assigned user	Views, enquiries, conversion
Location or operating base	Price and currency	Approval and publication status	Quality and visibility
Created and updated dates	Availability and expiry	Reviewer and action required	Last calculated date

Filters and controls

- Search by title, reference, company, agent, location or registration number.
- Filter by category, offering, asset type, company, user, status, score range and date.
- Sort by newest, oldest, price, quality, visibility, views, leads or expiry.
- Switch between table and card views without losing filters.
- Server-side pagination and export of the current filtered result.
- Bulk pause, archive, assign and request availability confirmation where allowed.

Listing actions

Edit

Update permitted fields and show what will require a new review.

Preview

See the public page before submission or publication.

Duplicate

Create a new draft without copying unique references or documents incorrectly.

Submit

Validate required data, show the current score and confirm submission.

Pause or renew

Remove from public search temporarily or confirm continued availability.

Archive

Remove from active operations while preserving history and reporting.

Listing detail tabs

SECTION 09

Dynamic listing creation flow

The form must adapt to the selected category and offering. Do not place every field for every asset on one screen.

Form behaviour

- Autosave every completed step and show the last saved time.
- Allow Save Draft, Preview, Back, Continue and Submit from predictable locations.
- Validate fields immediately and again before submission.
- Show a side checklist of missing required items and current quality score.
- Generate a description only after the key factual fields are completed; the user must be able to edit it.
- Keep a version history when approved fields are changed.
- Clearly identify changes that require a new platform review.

Media management

- Cover image, gallery, floor plans, supporting documents, video and 360 media where applicable.
- Drag-and-drop ordering, image rotation, crop guidance and cover selection.
- Minimum image count and image dimension checks by category.
- Duplicate-image detection and clear upload progress or failure messages.
- Store original media securely and create optimised public versions.

Do not use one fixed price field

The form must support currency, sale price, annual rent, monthly rent, daily rate, charter rate or price on request according to the selected offering. The public display must use the same stored pricing structure.

SECTION 10

Category-specific data requirements

These are the minimum field groups. The developer should convert them into configurable schemas so new asset types can be added without rebuilding the entire form.

Category	Core information	Category-specific examples
Real Estate	Offering, property type, emirate, community, building, price, size	Bedrooms, bathrooms, furnishing, completion, floor plan, permit, amenities, map, availability.
Cars	Make, model, variant, year, price, location	Mileage, regional specification, condition, service history, warranty, colour, registration, rental terms.
Yachts	Builder, model, year, price or charter rate, location	Length, beam, cabins, guests, crew, engine hours, flag, registration, charter availability.
Private Aviation	Manufacturer, model, year, sale or charter, operating base	Passenger capacity, range, total time, engines, configuration, registration, availability.
Collectibles	Type, maker or artist, year, price, location	Provenance, condition, dimensions, edition, certificate, custody and authenticity support.

Shared field groups

Identity

Title, internal reference, public reference and asset ownership relationship.

Commercial

Offering, price structure, currency, negotiability and taxes or fees where relevant.

Location

Country, city, area, exact location privacy and operating base.

Media

Cover, gallery, plans, video and supporting files.

Verification

Required permits, registration, authority to list and document expiry.

Contact

Responsible company, primary user, backup user and customer contact methods.

Configuration requirement

The Super Admin should be able to mark fields as required, optional or hidden by category, asset type and offering. These rules should not require a code deployment for every small change.

Validation examples

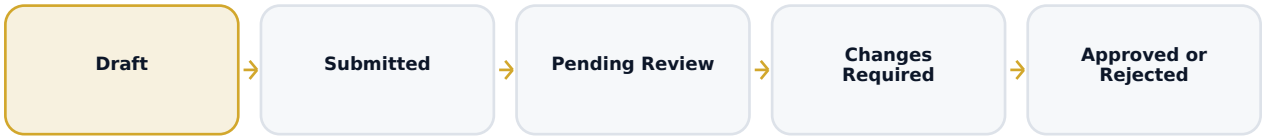

- A rental listing cannot be submitted without a rent period.
- A yacht charter listing cannot use a property bedroom field.
- A real estate listing cannot become live if its required permit is missing or invalid.
- A duplicate registration or permit number must be flagged before approval.

SECTION 11

Approval, publication and change workflows

One status cannot explain the complete listing lifecycle. Approval, publication, availability and documents must be tracked separately.

Listing approval

Listing publication

Document status

Event	Expected system behaviour
Reviewer requests changes	Partner receives the exact reason, affected field and resubmit action.
Approved listing edited	Low-risk changes publish directly if allowed; controlled fields trigger re-review.
Required document expires	Listing is warned, then paused or made ineligible according to the configured rule.
Availability is not confirmed	Partner receives reminders; stale listings lose freshness or become paused.
Listing rejected	The reason is permanent in history; a corrected copy may be submitted if allowed.
Manual admin override	Reason, administrator, previous value and new value are saved in the audit log.

User-facing language

Do not show only Rejected. Show what failed, why it failed, who needs to act and what the user should do next.

SECTION 12

Listing Quality Score

The quality score explains how complete, accurate and trustworthy a listing is. It should not be presented as the same thing as search rank.

82	+8	3	Today
QUALITY SCORE	AVAILABLE POINTS	ACTIONS REQUIRED	LAST CALCULATED

Component	Initial points	What is checked
Required details	20	Category and offering fields are complete and internally consistent.
Media	20	Image count, dimensions, diversity, cover image and supporting media.
Verification	25	Required documents, authority, registration or permit validity.
Title and description	15	Clear title, useful description, no prohibited or duplicate text.
Location and specifications	10	Accurate location and important category-specific specifications.
Freshness and availability	10	Recently confirmed information and valid availability.

What the owner should see

- Score out of 100 and rating: Excellent, Good, Needs Attention or Incomplete.
- Score breakdown by component.
- Exact failed checks and the fields connected to them.
- Estimated point improvement for every recommended action.
- Last calculation date and previous score history.

Example shown to the company

Your listing is 82/100. Add six more high-resolution images (+5), upload the floor plan (+3) and confirm availability (+4). Completing these actions can raise the listing to Excellent.

Technical requirement

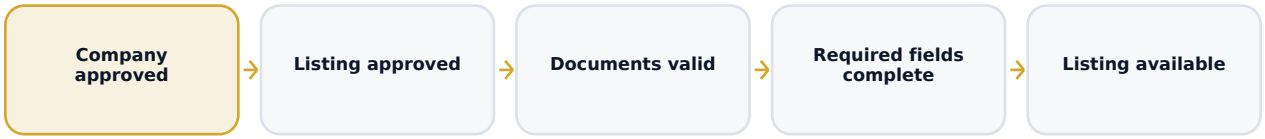

Quality rules must be configurable by category and versioned. Save a score snapshot with the component values and reasons so the team can explain why a score changed.

SECTION 13

Search visibility and why a listing is not on top

There is no single permanent page position. Search results change according to category, location, filters, sorting, availability and sponsored placements. The dashboard should explain visibility honestly.

First check eligibility

Initial organic visibility model - configurable

Component	Starting weight	Purpose
Search relevance	30%	Match category, asset type, offering, location, price and selected filters.
Listing quality	25%	Use the category-specific quality score.
Freshness and availability	15%	Reward recently confirmed and genuinely available inventory.
Company response performance	10%	Consider response rate and first-response time without exposing private lead data.
Engagement	10%	Use meaningful views, saves and enquiries with protection against manipulation.
Price context	10%	Use only when there is enough reliable comparable inventory.

What the company sees

- Visibility level: High, Medium, Low or Not Eligible.
- Top 10%, Top 25%, Top 50% or Low Visibility for a selected search context.
- Estimated position and total competing listings, with the last calculated time.
- The three strongest reasons affecting visibility.
- An Improve Visibility action opening the exact fixes.

Example explanation

Low Visibility - currently around the top 42% for 2-bedroom apartments for sale in Dubai Marina. Main reasons: only five images, availability not confirmed for 26 days and response time is slower than similar companies.

SECTION 14

Ranking controls, fairness and sponsored positions

The ranking system must remain explainable, configurable and protected from simple manipulation.

Admin controls

- Configure component weights by category and offering.
- Turn individual factors on or off without a new deployment.
- Preview how a rule change affects a sample result before publishing it.
- Version every ranking rule and save the effective date.
- Recalculate affected listings after a published change.
- Allow a manual exception only with a reason and full audit history.

Protection rules

Risk	Required protection
Repeated self-views	Exclude suspicious or repeated activity from engagement scoring.
Duplicate inventory	Detect repeated registration, permit, address, media or ownership indicators.
Constant minor edits	Do not treat every small text change as a full freshness reset.
New listings with no data	Give a reasonable discovery window without permanently disadvantaging established listings.
Paid placement	Keep sponsored positions separate and clearly labelled. Do not change the organic quality score.
Low-volume categories	Do not use price or engagement comparisons when the sample is too small.

What we should not promise

Do not guarantee page one or a fixed position. Show an estimated position, percentile and improvement actions because the real result depends on each customer's search and sorting choices.

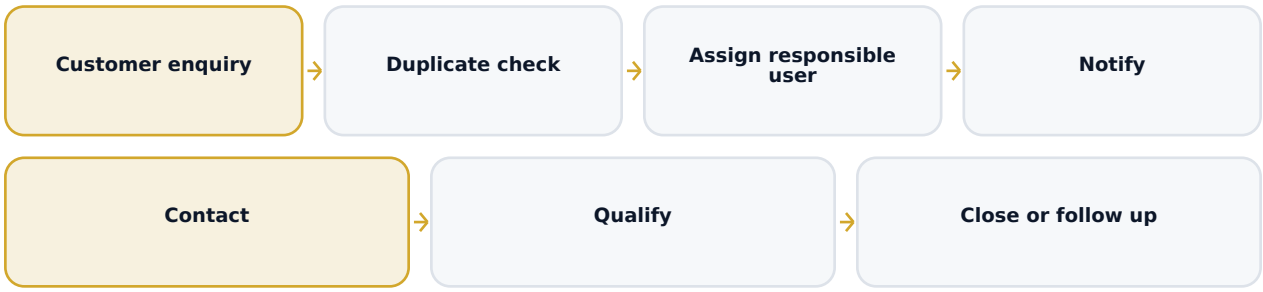

Calculation timing

- Recalculate immediately after an approved listing change.
- Update freshness and availability on a scheduled job.
- Update response and engagement factors after validated activity is processed.
- Save the previous score and reasons for comparison.

SECTION 15

Lead and enquiry management

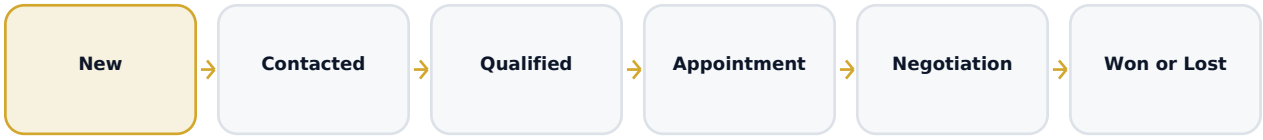

Every enquiry must be connected to the correct listing, company and responsible user. Without this connection, response performance and listing conversion cannot be trusted.

Lead record

Group	Required data
Customer	Name, phone, email, country, preferred contact and consent record where required.
Source	Listing, page, form, call, WhatsApp, email, campaign source and UTM data.
Ownership	Company, primary user, previous assignees and assignment reason.
Timing	Created time, first opened, first response, last activity and next follow-up.
Qualification	Status, intent, budget, timeframe, notes and outcome.
History	Calls, messages, notes, status changes, assignments and exports.

Recommended lead stages

Routing rules

- Send the enquiry to the listing's primary agent first.
- Notify the manager if it is not opened or contacted within the configured response window.
- Allow reassignment, round-robin or an unclaimed queue according to company settings.
- Keep the complete assignment history and do not overwrite the original owner silently.
- Allow company owners to define office hours and backup users.

SECTION 16

Performance tracking and reports

Tracking must begin before launch. Historical views, clicks and enquiries cannot be recreated later if the events were never recorded.

Events to record

Impression

Listing appeared in a search or recommendation result.

Listing view

Customer opened the listing detail page.

Contact action

Phone reveal, call click, WhatsApp click or email click.

Enquiry

Customer submitted a form or a tracked conversation was created.

Engagement

Favourite, share, media interaction or return visit.

Outcome

Qualified lead, appointment, negotiation, won or lost.

Every event should include

- Listing ID, company ID, category, responsible user and timestamp.
- Anonymous session or authenticated customer reference where allowed.
- Page, search context, filters, source and UTM details.
- Device and country at the level permitted by the privacy policy.
- Controls to exclude platform staff, bots and suspicious repeated activity.

Dashboard metrics

Metric	Definition
Click-through rate	Listing views divided by valid impressions.
Enquiry conversion	Valid enquiries divided by listing views.
First-response time	Time from enquiry creation to the first recorded agent response.
Response rate	Enquiries receiving a response within the configured window.
Qualified rate	Qualified enquiries divided by valid enquiries.
Listing outcome	Won, lost or archived outcome connected to the original enquiry where available.

Reporting controls

Date range, category, offering, company, agent and listing filters; daily, weekly and monthly comparison; export of the filtered result; clear data freshness timestamp.

SECTION 17

Notifications, documents, security and audit

The dashboard will store sensitive company and identity documents. Access and history must be designed before production use.

Notification centre

Priority	Examples	Delivery
Urgent	Listing suspended, required document expired, account security event	In-app and email; optional SMS or WhatsApp later.
Action needed	Changes requested, unanswered enquiry, availability confirmation	In-app and email with a direct action link.
Information	Listing approved, weekly performance summary, export ready	In-app and configurable digest.

Security requirements

- The authenticated user role is determined by the backend. A visual role selector must never grant access.
- Company data is isolated by company ID on every query and file request.
- Individual accounts, secure password reset, session controls and multi-factor authentication for sensitive roles.
- Identity and company documents are encrypted, served through expiring links and restricted by role.
- Record document views, downloads, replacements and deletions.
- Rate limiting, upload type validation, malware scanning and secure backups.
- Define retention and deletion rules before collecting passports or identity documents.

Audit log

Record the actor, company, action, object, previous value, new value, reason, date, time and technical request reference for sensitive changes. Audit records should be searchable and protected from normal editing.

> **Sensitive document rule**
>
> Only authorised reviewers and the owning company should access verification documents. Agents should not automatically receive access to company ownership documents or other users' identity records.

SECTION 18

Backend services and core records

The interface can change over time, but these records and services must remain consistent. This is the minimum backend structure required for the dashboard.

Domain	Core records	Main responsibility
Organisation	Company, CompanyCategory, CompanyVerification	Company identity, enabled categories and approval lifecycle.
Identity	User, Role, Permission, AgentProfile, Invitation	Authentication, access and individual profiles.
Catalogue	Category, AssetType, OfferingType, FieldDefinition	Configurable forms, filters and public classification.
Listings	Listing, ListingFieldValue, Media, Document, Availability	Asset information, ownership, media and lifecycle.
Review	ApprovalReview, ReviewComment, StatusHistory	Admin decisions, partner corrections and history.
Scoring	QualityRule, QualitySnapshot, RankRule, RankSnapshot	Explainable quality and search visibility calculations.
Leads	Lead, Assignment, LeadActivity, FollowUp	Enquiry routing, ownership, activity and outcomes.
Analytics	PerformanceEvent, DailyRollup, ReportExport	Event collection, aggregation and reporting.
Operations	Notification, AuditLog, FileAccessLog, SystemSetting	Alerts, traceability, security and configuration.

Background jobs

- Recalculate quality and visibility after approved changes.
- Create daily performance summaries without deleting raw events.
- Check document, permit and listing expiry dates.
- Send stale-listing and availability reminders.
- Escalate unanswered enquiries according to the company response rule.
- Process exports and notify the user when the file is ready.

Implementation requirement

Do not store important rules only inside interface code. Status transitions, permissions, scoring and tenant isolation must be enforced by the backend so they work consistently across every screen and future integration.

SECTION 19

Permission summary and current interface corrections

The current visual direction is premium and should be retained. The operational screens need greater clarity, stronger contrast and more useful actions.

Capability	Owner	Manager	Agent	Coordinator	Platform Admin
View all company listings	Yes	Yes	Assigned	As allowed	All
Create listing draft	Yes	Yes	If allowed	Yes	Yes
Submit to platform	Yes	If allowed	If allowed	No	Not applicable
View all company leads	Yes	Yes	Assigned	No	All as required
Assign leads	Yes	Yes	No	No	Override only
Manage company users	Yes	If allowed	No	No	Support or suspend
Approve companies or listings	No	No	No	No	Yes
Change ranking rules	No	No	No	No	Super Admin only

Current interface corrections

- Rename Portfolio to Overview or Dashboard. Keep Listings as the management section.
- Rename Listings Approval to Listing Approvals.
- Replace New Asset Acquisition with Create Listing.
- Replace Jets Helicopters with Private Aviation.
- Correct the login copy and all visible spelling errors.
- Fix the clipped top-right action button and test common desktop and mobile widths.
- Use consistent currency formatting and date formats.
- Increase contrast for pale labels, helper text and disabled controls.
- Replace the eye-only approval action with direct review actions.
- Remove broken logos, test companies and sample listings before launch.
- Use the available page width more efficiently on operational tables.

SECTION 20

Definition of done and final acceptance test

The dashboard is complete only when the team can demonstrate the full working journey with real data, correct permissions and recorded history.

Required end-to-end demonstration

During the demonstration I need to see

- The administrator requests a document correction and the owner receives the exact reason.
- The owner invites an agent, applies permissions and assigns a listing.
- The agent creates a draft and the manager submits it for platform review.
- The quality score identifies missing items and updates after corrections.
- The listing becomes live only after approval and eligibility checks.
- Impressions, views and a test enquiry appear in the correct dashboards.
- The enquiry is assigned, notified, contacted and moved through the lead stages.
- The company sees visibility reasons and improvement actions.
- Every important action appears in the status and audit history.

Technical completion checklist

Area	Acceptance requirement
Data	Real database records, correct relationships, no static dashboard numbers and no production test data.
Permissions	Every role tested for allowed and blocked actions; company isolation verified.
Operations	Search, filters, sorting, server-side pagination, export and bulk actions work.
States	Loading, empty, validation, error, success and permission-denied states are designed and tested.
Responsive	Core workflows work on common desktop, tablet and mobile widths without clipping.
History	Status, assignment, score, review and sensitive admin actions are recorded.
Performance	Pages load reliably with realistic data volumes and large media libraries.
Recovery	Backups, failed upload handling, retry behaviour and rollback plan are documented.

SECTION 21

Delivery priorities and decisions to close in the meeting

The team should leave the meeting with one agreed scope, not a collection of future ideas. The items below define the production dashboard.

Production dashboard - priority order

Priority	Scope
1. Foundation	Company structure, individual users, roles, permissions, categories, offerings and status model.
2. Onboarding	Company registration, category verification, review comments, resubmission and team invitations.
3. Listings	Dynamic forms, media, drafts, company review, platform approval and scalable management table.
4. Quality and visibility	Quality score, eligibility checks, search context, reasons and improvement actions.
5. Leads	Capture, routing, notifications, response tracking, stages and company ownership.
6. Performance	Event tracking, reports, filters, exports and data freshness.
7. Operations	Notifications, document expiry, audit, security, backups and production cleanup.

Decisions to confirm today

- Final role list and permission matrix.
- Final category, asset type and offering structure.
- Required fields and documents for each launch category.
- Company, listing, document and lead status transitions.
- Quality components, visibility components and configurable weights.
- Lead assignment and response escalation rules.
- Complete page map for owner, manager, agent and platform admin.
- Tracking events, dashboard metrics and report definitions.
- Security controls for identity and company documents.
- Staging demonstration date and named owner for every remaining item.

Final instruction to the developer team

Please do not mark the backend dashboard as finished because the pages are visible. I need one complete workflow, connected to real data, with permissions, explanations, actions, history and reporting working from beginning to end.
